1. Overview
   - Mechanical Ventilation is a treatment option to support patient’s respiration and ventilation addressing hypoxemic and/or hypercapnia respiratory failure. Mechanical Ventilation consists of either non-invasive or invasive ventilation using an endotracheal tube.

2. Goal of the Procedure
   - The goal for mechanical ventilation in critical care is to optimize respiration and ventilation while managing reversible causes for acute respiratory failure.

Mandatory Video:
   - Ventilator 101
This video will explain all the basics in a very straightforward manner. Not only easy to understand but points out all the bullet points you need to know as a study guide.

Mandatory PowerPoint
Excellent PowerPoint summarizing all the key points in the video above.

5. Required Competencies
   - Discusses the criteria for NIPPV and invasive mechanical ventilation.
   - Discusses acute lung injury and mechanical ventilation:
   - Demonstrates CPAP and BiPap using a NIPPV mechanical ventilator.
   - Discusses PIP and Plateau Pressures in relation to expected and abnormal values.
   - Discusses the different ventilator settings and risks /benefits.
   - Demonstrates various ventilator settings titrating for changes in patient oxygenation and ventilation.
   - Discusses different ventilator alarms.
